Dee Loflin, SMT Manager/Editor*

United States - No enthusiastic sky-watcher misses a total eclipse of the moon, and if weather permits, neither should you!

If it's cloudy in your part of the world, then you can also [watch the eclipse live on Space.com](#), courtesy of NASA, the Slooh community telescope and the Virtual Telescope Project.

The spectacle is often more beautiful and interesting than one would think. During the time that the moon is entering into and later emerging from out of the Earth's shadow, secondary phenomena may be overlooked.

This [first total lunar eclipse of 2014](#) is set to begin tonight (April 14) into the wee hours of Tuesday morning (April 15). The lunar eclipse is set to begin at about 2 a.m. EDT (0600 GMT), and it should last about 3.5 hours. The eclipse should be visible, weather permitting, through most of North America and part of South America.
